# CREATING PACKAGES
# COMMON.EXE

Get the sources :
Download the .EXE source for your software from the publisher's website.

To develop your packages, it is preferable to have WAPTDEV on your management machine.
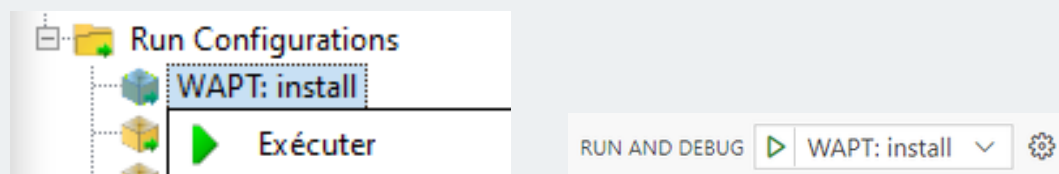

Generate the package template :
Get the template for your package from the downloaded source.

Edit the package :
Validate the UAC if necessary to open the IDE (PyScripter/VSCode).

Run the installation in DEV mode (in the IDE).

Retrieve the software key:
Use the command 'wapt-get list-registry' followed by the name of the freshly installed software and add the key in the 'key' field of 'install_exe_if_needed'.

Confirm installation :
Confirm that the installation has been detected using the key by restarting the installation.

In the 'Private repository' tab, click on 'Build and import a package into the repository'.
Then select the folder where the package has just been developed.
