

HOW TO MANAGE A CERTIFICATE

The private key :

In the WAPT console, click on the 'Tools' tab then 'Generate a certificate'.

Certificate :

Add the name of the certificate, as well as the key password. Optional: You can fill in the certificate information.

The key pair :

A key pair is then generated.

When the agent is generated, the CRT from the generated key pair must be in the agent.

Without it, no action will be possible on the agents.

CAREFUL

There are only a few specific cases where the key needs to be regenerated, such as theft of the key and its password.

It is necessary to keep the CRT and the .pem.

If you reinstall the console or carry out a server migration or upgrade, you must keep the original key.
