# TEST YOUR
PACKAGES

Import the package: tis-add-preprod-maturity.
It adds PREPROD maturity to agents.

Deploy this package on the group of pilot machines of your choice, preferably a representative sample of your fleet.

By default, all WAPT agents are compatible with PROD maturity.

Packages presenting a risk will have to be imported into the PREPROD maturity to be tested on your pilot agents before being deployed across the entire fleet.

Once the tests have been validated in PREPROD, we modify the maturity of the packages in PROD so that they are visible to PROD maturity agents.

For more experimental tests you can also use DEV maturity
